Soheil Tehranipour

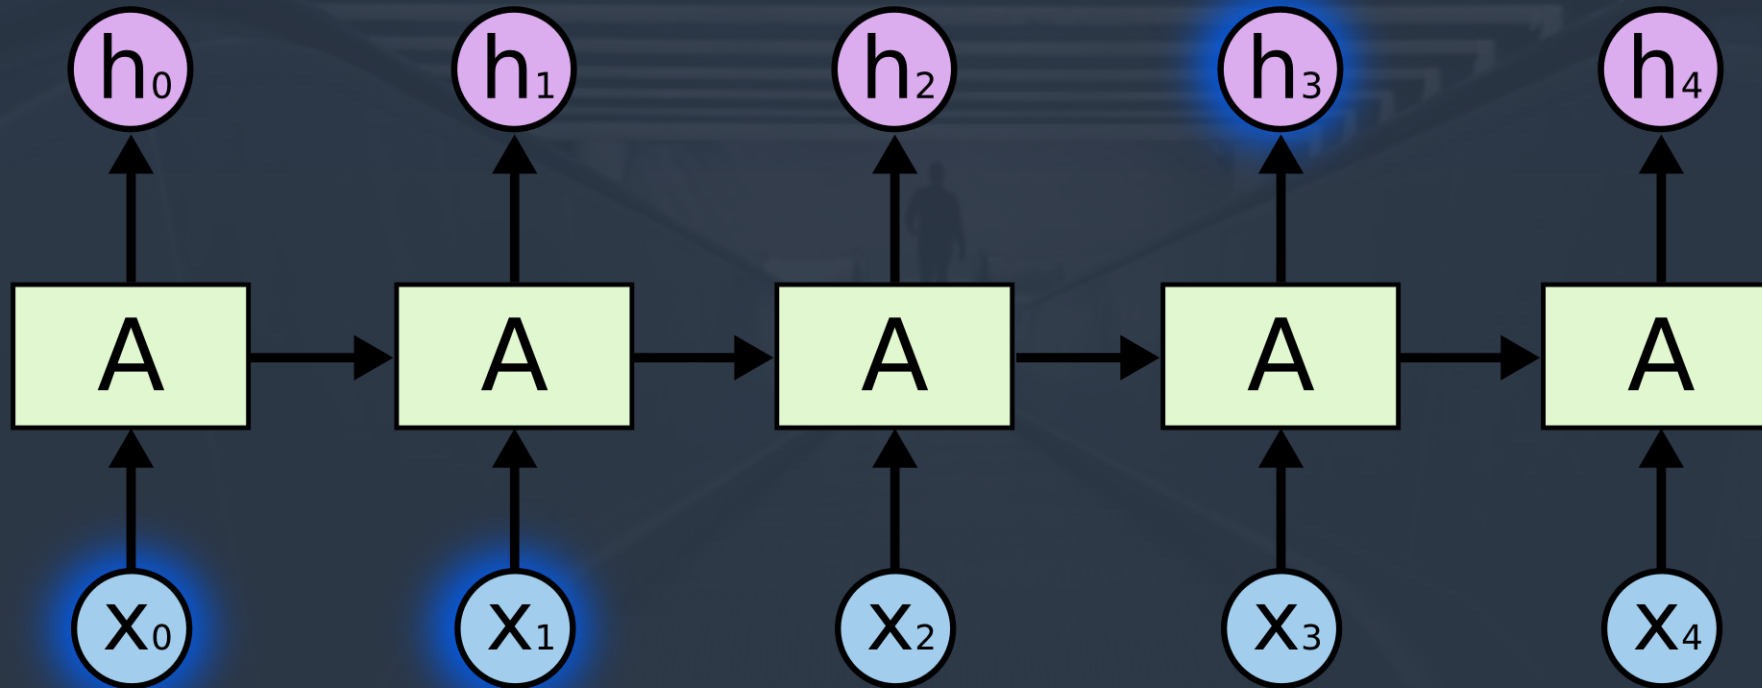

August 2023

- دکتری هوش مصنوعی و رباتیکز
- مدیر عامل شرکت دانش بنیان ساعیان ارتباط
- هوش مصنوعی در مراکز فرودگاه‌های سراسر کشور، گروه صنعتی انتخاب
- مدیر پروژه سامانه‌های مخابراتی مترو تهران
- تولید نرم افزار شناسایی موضوع متون از با استفاده از روش های هوش مصنوعی
- تولید نرم افزار شناسایی علایم راهنمایی و رانندگی در خودروهای بدون سرنشین
- تولید Chatbot فارسی در حوزه سامانه‌های پروازی
- مدرس دوره‌های یادگیری ماشین و علم داده در همراه اول، وزارت نفت، بیمه ایران
- هم بنیان گذار Iran Machine Learning

RNN

(Recurrent Neural Network)

What is RNN?

Advantages of Recurrent Neural Network

1. RNN can model sequence of data so that each sample can be assumed to be dependent on previous ones
2. Recurrent neural network are even used with convolutional layers to extend the effective pixel neighborhood.

Disadvantages of Recurrent Neural Network

1. Gradient vanishing and exploding problems.
2. Training an RNN is a very difficult task.
3. It cannot process very long sequences if using *tanh* or *relu* as an activation function.

1. Unlike feedforward neural networks, RNNs can use their internal state (memory) to process sequences of inputs.

2. DNN is not for Sequential Data.

What is Simple RNN?

Simple RNN (Unrolled)

Input

X^1

Input

X^2

RNN Advantages ?

- **RNN Advantages:**

- Can process any length input
- Model size doesn't increase for longer input
- Computation for step t can (in theory) use information from many steps back
- Weights are shared across timesteps → representations are shared

- **RNN Disadvantages:**

- Recurrent computation is slow
- In practice, difficult to access information from many steps back

Simple RNN Disadvantages?

Vanishing Gradient Problem

A goldfish has a memory span of three seconds

GRU

(Gated Recurrent Unit)

What is LSTM?

TWO Gates of GRU Cell:

- Update Gate

$$z^{(t)} = \sigma(W^z[h^{(t)}, x^{(t)}] + b^z)$$

- Reset Gate

$$r^{(t)} = \sigma(W^r[h^{(t)}, x^{(t)}] + b^r)$$

Time Series Analysis with LSTM

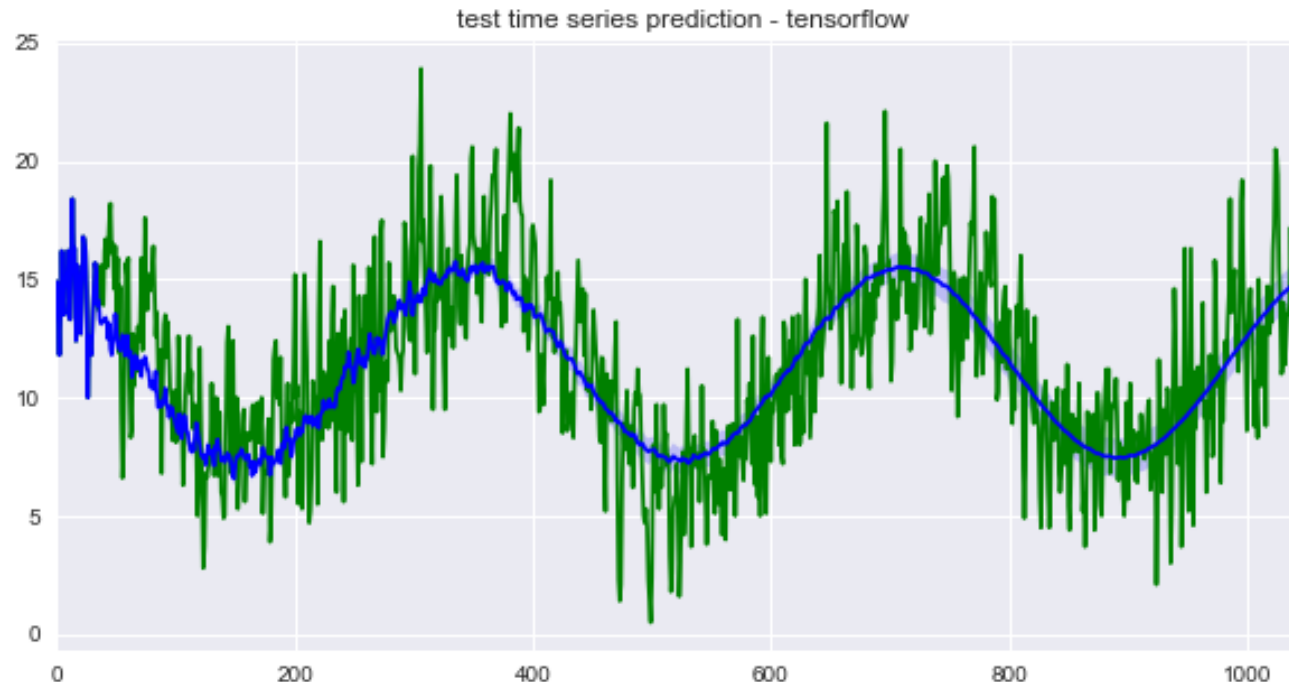

Time Series Data?

What is Autoregression?

A time series is a sequence of measurements of the same variable(s) made over time.

An **autoregressive model** is when a value from a time series is regressed on previous values from that same time series. for example, y_t on y_{t-1} :

$$y_t = \beta_0 + \beta_1 y_{t-1} + \epsilon_t.$$

Different kind of Time-Series dataset (Multivariate Time Series)

The number of observations recorded for a given time in a time series dataset matters. Traditionally, different names are used:

- **Univariate Time Series:** These are datasets where only a single variable is observed at each time, such as temperature each hour.
- **Multivariate Time Series:** These are datasets where two or more variables are observed at each time.

Most time series analysis methods, and even books on the topic, focus on univariate data. This is because it is the simplest to understand and work with.

Multivariate data is often more difficult to work with. It is harder to model and often many of the classical methods do not perform well.

Different kind of Time-Series dataset (Multi-Step Forecasting)

The number of time steps ahead to be forecasted is important.

Again, it is traditional to use different names for the problem depending on the number of time-steps to forecast:

- **One-Step Forecast:** This is where the next time step ($t+1$) is predicted.
- **Multi-Step Forecast:** This is where two or more future time steps are to be predicted.

**Time Series Forecasting as
Supervised Learning**

List of Time Series Method

1. Autoregression (AR)
2. Moving Average (MA)
3. Autoregressive Moving Average (ARMA)
4. Autoregressive Integrated Moving Average (ARIMA)
5. Seasonal Autoregressive Integrated Moving-Average (SARIMA)
6. Seasonal Autoregressive Integrated Moving-Average with Exogenous Regressors (SARIMAX)
7. Vector Autoregression (VAR)
8. Vector Autoregression Moving-Average (VARMA)
9. Vector Autoregression Moving-Average with Exogenous Regressors (VARMAX)
10. Simple Exponential Smoothing (SES)
11. Holt Winter's Exponential Smoothing (HWES)
12. Prophet
13. Naive method
14. LSTM (Long Short Term Memory)
15. STAR (Space Time Autoregressive)
16. GSTAR (Generalized Space Time Autoregressive)
17. LSTAR (Logistic Smooth Transition Autoregressive)
18. Transfer Function
19. Intervention Method
20. Recurrent Neural Network
21. Fuzzy Neural Network

What is Autoregression solutions?

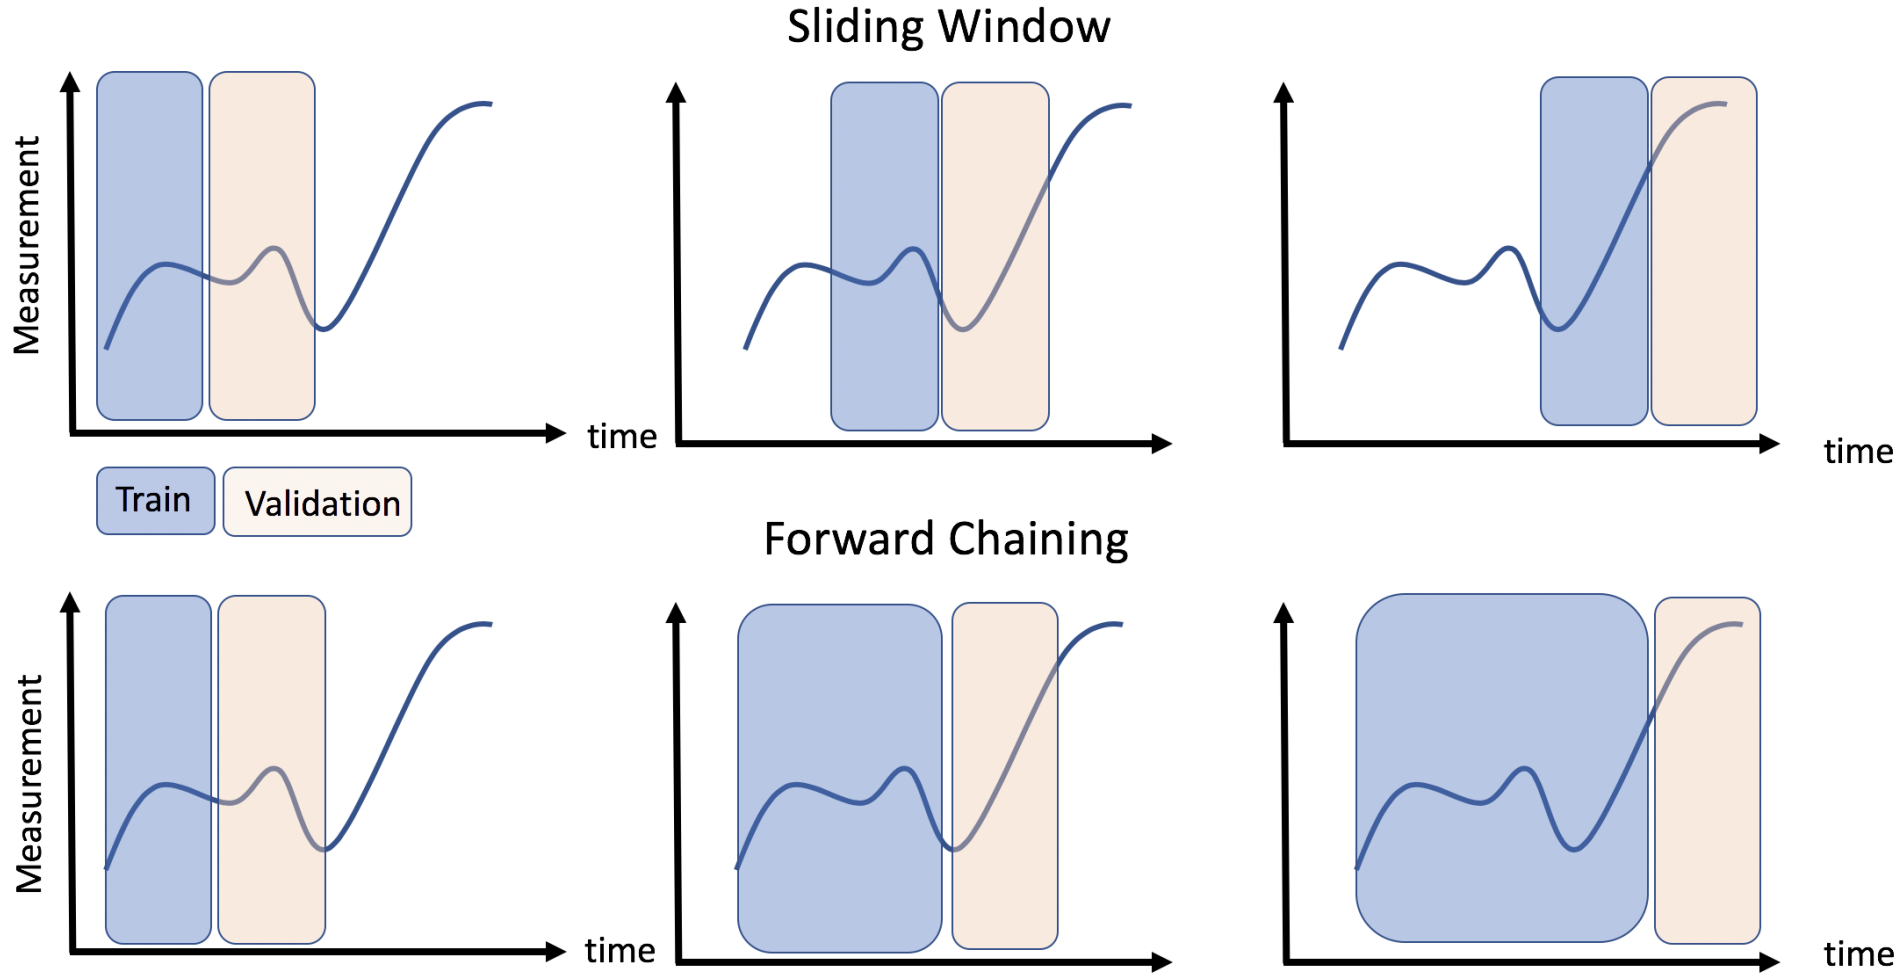

ARIMA, short for **'Auto Regressive Integrated Moving Average'** is actually a class of models that 'explains' a given time series based on its own past values, that is, its own lags and the lagged forecast errors, so that equation can be used to forecast future values.

A screenshot of the statsmodels v0.11.1 documentation page for the ARIMA model. The page has a dark blue header with the statsmodels logo, version number, a search bar, and GitHub repository information. The main content area is white and shows the class name 'statsmodels.tsa.arima_model.ARIMA' with a 'Show Source' link. Below the class name is the Python class signature: `class statsmodels.tsa.arima_model.ARIMA(endog, order, exog=None, dates=None, freq=None, missing='none')[source]`. Underneath, it says 'Autoregressive Integrated Moving Average ARIMA(p,d,q) Model' and 'Parameters'. A left sidebar contains a navigation menu with items like 'Installing statsmodels', 'Getting started', 'User Guide', 'Background', 'Regression and Linear Models', and 'Time Series Analysis'.

What is Autoregression solutions?

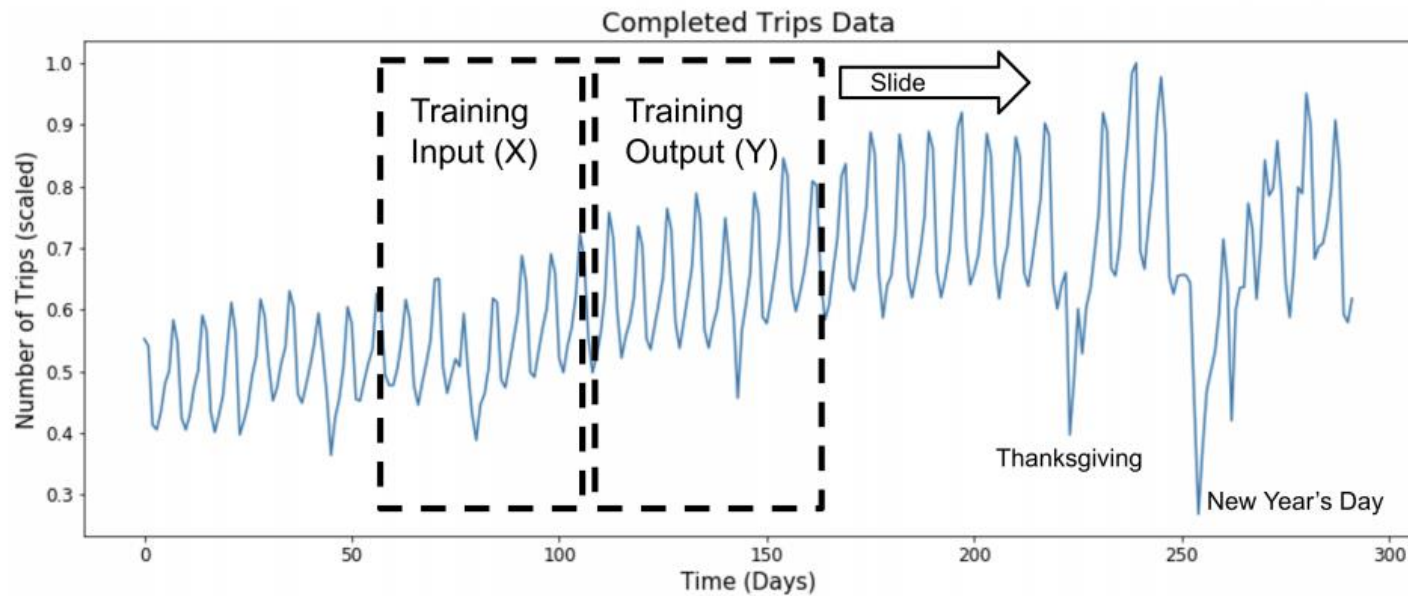

Sliding window vs. forward chaining cross validation

LSTM Model Architecture for Rare Event Time Series Forecasting

A training dataset was created by splitting the historical data into sliding windows of input and output variables.

The specific size of the **look-back** and forecast horizon used in the experiments were not specified in the paper.

Scaled Multivariate Input for Model Taken from “Time-series Extreme Event Forecasting with Neural Networks at Uber”.

A close-up, black and white photograph of two hands. The hands are positioned palm-to-palm, with fingers slightly spread. The skin appears heavily textured, possibly due to a dark, fibrous material like a glove or a very dirty surface. The lighting is dramatic, highlighting the ridges and grooves of the skin. The background is dark and out of focus.
